*Front cover: GUR® UHMW-PE can be used for dock fenders or for ship bodies.*
Welcome to the world of GUR® UHMW-PE – an ultra high performance polyethylene powder encompassing both ultra high and very high molecular weight polyethylene.

First launched in 1955 in Oberhausen (Germany), GUR® UHMW-PE has become synonymous with high quality, performance and innovation representing a unique thermoplastic and engineering material in our portfolio.

From the early 1950s to the present day, Celanese has been and continues to be a leading pioneer in UHMW-PE, having developed a broad range of high performance powders in a wide array of applications.

We are the only truly global supplier of UHMW-PE serving our customers around the world from manufacturing facilities in Europe, North America and Asia.
GUR® UHMW-PE was first officially introduced to the world at the 1955 K-fair (International Plastics Show) in Düsseldorf, Germany.

The catalyst technology enabling GUR® UHMW-PE was discovered by Dr. Karl Ziegler in 1953 at his lab in Mülheim, Germany, which is very close to the first production facility in Oberhausen.

Since its inception, GUR® UHMW-PE has grown into the leading UHMW-PE product used in a broad range of applications.

Our first production plant in Oberhausen proudly continues to supply high quality products and delivering pioneering innovations to industry.

First applications in the textile industry: e.g. GUR® UHMW-PE replacing wood in textile shuttle.

Karl Waldemar Ziegler
1898-1973
Since the invention of GUR® UHMW-PE, Celanese has continued to invest in capacity and technology to meet the growing needs of our customers. Our broad manufacturing footprint is unique in the industry, enabling us to meet the global needs of our customers. Our dedicated facilities ensure consistent product quality and security of supply.

**Oberhausen, Germany**
The Oberhausen site is the original home of GUR® UHMW-PE, where production first started in 1960. About 80 employees at this site are involved in production, research, application development and quality assurance.

**Bishop, Texas**
The facility was built in 2002, replacing the first GUR® UHMW-PE plant in the US located in Bayport, Texas.

**Nanjing, China**
The latest GUR® UHMW-PE facility was built in the Celanese chemical complex in Nanjing, China to better serve our customers in Asia.
GUR® UHMW-PE
Unique Properties

Processing technologies
Standard processing technologies: pressure sintering, ram extrusion, porous sintering (without pressure). Other processing options (depending on grade): extrusion, membrane extrusion, gel spinning, injection molding.

Properties
- Exceptional notched impact strength
- Very good sliding properties
- Very low wear
- High chemical resistance
- Very good resistance to stress cracking
- Broad range of application fields due to temperature resistance ranging from -200 to +90 °C

Grades
- Standard grades, partially modified grades and specialty grades for pressure sintering, ram extrusion, and porous products
- Premium grades for orthopedic implants
- Special materials for melt processing
- Functional grades for heat conductance, antistatic properties, and as additives (e.g., micropowders)

GUR® UHMW-PE is a linear polyethylene and differentiated from other PE standard grades by a very high degree of polymerization. The molecular weight (= molar mass) determined by viscosimetry of our standard grades ranges from 3.9 to 10.5 million g/mole.

The extreme molar mass is responsible for the fact that the melted product does not flow (MFR = 0). Therefore, special processing methods like pressure sintering and ram extrusion are required. Given its unique low melt flow properties, GUR® UHMW-PE is not compounded into a pellet like most other thermoplastics but is sold as a powder.

During the manufacturing process, GUR® UHMW-PE powder can be produced with different molecular weights, bulk densities, average particle size and particle size distribution.

The different grades of GUR® UHMW-PE include different combinations of these variables which impart different performance characteristics of the material. With a broad range of grades, GUR® UHMW-PE powders are well-suited to meet a wide range of needs.
One of the most unique attributes of GUR® UHMW-PE is its extremely high impact strength, which is retained even at very low temperatures. The impact strength is so high, in fact, that under the standard notched impact test (ISO 179) GUR® UHMW-PE does not break. Therefore, a special “double-notched” impact test is used.

The results above clearly demonstrate the extreme outperformance of GUR® UHMW-PE relative to other polymers.

GUR® UHMW-PE has a relatively broad operating temperature range especially in cold temperatures. For example, GUR® UHMW-PE retains its wear resistance performance even at the temperature of liquid helium at -289 °C. While GUR® UHMW-PE does not melt even at extremely high temperatures, we recommend not to exceed a constant operating temperature of 80 °C.
Another truly unique property of GUR® UHMW-PE is its extreme abrasion resistance which can be, as shown in chart above, almost twice as good as steel. This makes GUR® UHMW-PE the material of choice in applications where wear is extremely high and customers are looking for a material to extend the lifetime of critical parts.

GUR® UHMW-PE is also an excellent material for sliding applications. GUR® UHMW-PE possesses self-lubricating properties which allow it to perform very well in “dry sliding” situations such as against metal surfaces like steel, brass or copper.

Abrasion resistance and natural lubricity make GUR® UHMW-PE the perfect material for bushings which are liners in cylinders with rotating shafts. In addition to minimizing friction, GUR® UHMW-PE is also tolerates foreign particles (e.g., dust, sand, etc.) which can cause misalignment.
As can be seen from the limited selection here, the unique properties and form flexibility of GUR® UHMW-PE makes it the material of choice for a very broad range of applications.

From medical, to high tech or food industries, GUR® UHMW-PE offers its unique set of properties to address different application needs. From chemical resistance to surface slip properties or a pressed plate, membrane or fiber, GUR® UHMW-PE has proven itself as a truly unique and adaptable material.

**Lead-acid battery separators**
- GUR® UHMW-PE is used as a binder for separators in lead-acid batteries, for automotive starter batteries.
- The separator prevents short circuits between the anode and cathode.

**Semi-finished products, plates and profiles**
- Components that are exposed to wear, e.g. castors, cog wheels, chain guides, bearing bushings, chain tensioners.
- Linings for handling of bulk goods, e.g. conveying troughs, slides, wagons, bunkers.
- Pumps and valves for chemically demanding media.
- GUR® UHMW-PE components are also applied in the fields of sound and shock absorption.

**Microporous membranes**
- GUR® UHMW-PE microporous membranes have multiple applications as separators in lithium ion batteries, ultracapacitors and fuel cells.
- Also used as breathable membrane in outdoor garments, as air-coalescing & liquid filters, and as membrane in transdermal drug delivery patches.
Medical engineering

- Celanese’s special GUR® UHMW-PE medical grades are used as bearing partners in endoprostheses (artificial joints).
- Orthoses, either for a temporary immobilization of selected parts of the body (e.g. ankles) or to be worn as a corset (trunk orthosis).
- Special medical filters.

Filtration

- Porous parts which are manufactured from GUR® UHMW-PE powders are used for filtering liquids, particulates and gases.
- Sintering without pressure also enables high-strength dust filters for very diverse separation tasks.
- GUR® UHMW-PE constitutes the matrix in activated carbon filters used in water treatment.

Functional additives

- In paints and coatings GUR® UHMW-PE microporous modify the surface texture
- GUR® UHMW-PE is used in rubber as a modifier in tires and belts
- Polishing media

Fibers

- Gel spinning technology enables manufacturing of extremely high-strength and stretch-resistant filament yarn, e.g. for cut-resistant gloves.
- GUR® UHMW-PE filaments are also used to manufacture fabrics to absorb the impact of projectiles, for example, bullet-proof vests.
- GUR® UHMW-PE-based fibers have numerous application-specific advantages in maritime and other civil fields, e.g. plaited fishing lines and fishing nets, as well as mooring ropes.
GUR® UHMW-PE
Semi Finished Goods

Benefits of GUR® UHMW-PE semi-finished goods
- Wear, impact and chemical resistant

Applications/properties
- Truck linings
- Dock fenders
- Chain guides
- Ski soles
- Pump valves

Applications/properties
GUR® UHMW-PE is used in packaging and filling plants, food industry, transport, conveying and storage technology, assembly systems and the printing and textile industries. GUR® UHMW-PE is in profiles for chain/belt drives, curved guides, chain and belt deflecting and tensioning devices, bearing bushings, rail track disks -and impact-absorbing elements can provide a trouble-free operation with low maintenance.

Sliding surfaces made from sintered GUR® UHMW-PE are used worldwide for Alpine and cross-country skis and snowboards, ice-skating rinks and bowling alleys.

Pumps and shut-off valves are used used in chemical plants, waste incineration and wastewater treatment that operate in harsh environments, where the components come under attack from aggressive acids, alkalis and gases as well as abrasive solids. The tough qualities of GUR® UHMW-PE ensure that reliability and service endurance are not compromised.

In addition, the good slip properties of GUR® UHMW-PE make for smooth-running pump impellers.

The good slip properties of GUR® UHMW-PE are also the reason why this material is widely used in linings for conveyor troughs, silos and truck bodies. The rare combination of low friction coefficient with exceptional wear resistance is the key material selection factor. GUR® UHMW-PE lining sheets ensure rapid loading and discharging of bulk products.

Since GUR® UHMW-PE can also be antistatic-modified, the risk of explosions due to dusty environments (e.g., mining and coal preparation) can be minimized.
Lead-acid Batteries are used in today’s cars for starting, lighting and ignition (SLI battery). Starting (or cranking) of a combustion engine requires large bursts of energy.

Lead-acid batteries are able to deliver these high currents and peaks and can be recharged for >1000 cycles. The separator must ensure no short circuits between anode and cathode inside the “flooded cell” type battery (35% sulfuric acid and 65% water).

GUR® UHMW-PE is used as binder in the separator. The separator is made of GUR® UHMW-PE, silica, antioxidant and oil in a gelation process. The blend is extruded and the oil extracted afterwards.

An effective separator must possess a number of mechanical properties; such as permeability, porosity, pore size distribution, specific surface area, mechanical design and strength, electrical resistance, ionic conductivity, and chemical compatibility with the electrolyte. In service, the separator must have good resistance to acid and oxidation. The area of the separator must be a little larger than the area of the plates to prevent material shorting between the plates. The separators must remain stable over the battery’s operating temperature range.

Benefits of GUR® UHMW-PE in lead acid battery separators

- **GUR® UHMW-PE separators offer a cost-effective performance**
- **GUR® UHMW-PE separators allow rapid fabrication of a pocket**
- Constant Quality

Requirements

- Microporous
- No obstruction of ion flow at low temperature
- Avoidance of short circuit by metal particles or PbSO₄ growth
- High puncture resistance
- Resistant to H₂SO₄ and oxidation

Applications

- Automotive
- Industrial and recreational

Structure of a lead acid car battery: multiple separator envelopes are stacked together

Lead-acid Batteries are used in today’s cars for starting, lighting and ignition (SLI battery). Starting (or cranking) of a combustion engine requires large bursts of energy.

Lead-acid batteries are able to deliver these high currents and peaks and can be recharged for >1000 cycles. The separator must ensure no short circuits between anode and cathode inside the “flooded cell” type battery (35% sulfuric acid and 65% water).

GUR® UHMW-PE is used as binder in the separator. The separator is made of GUR® UHMW-PE, silica, antioxidant and oil in a gelation process. The blend is extruded and the oil extracted afterwards.

An effective separator must possess a number of mechanical properties; such as permeability, porosity, pore size distribution, specific surface area, mechanical design and strength, electrical resistance, ionic conductivity, and chemical compatibility with the electrolyte. In service, the separator must have good resistance to acid and oxidation. The area of the separator must be a little larger than the area of the plates to prevent material shorting between the plates. The separators must remain stable over the battery’s operating temperature range.
Microporous membranes are vital elements to both function and safety in the energy storage market in particular lithium ion batteries. Lithium ion batteries are the primary technology used for batteries in cell phones, smart phones, tablets and computers. In addition to consumer electronics, lithium ion battery technology is being used for stationary storage. For example, solar and wind energy generators use lithium ion batteries as a means to store energy during peak times for use during off-peak hours. Finally, the recent rapid growth in electric mobility (e.g. cars, buses, bikes, etc.) would not be possible without lithium ion batteries for efficient and safe energy storage and delivery.

Microporous membranes made from GUR® UHMW-PE separate the positive and negative electrodes in these batteries allowing the flow of lithium ions due to its porosity. Without this flow of ions, there would be no energy delivery to the growing consumer electronics market. The membranes also act as a fire and explosion hazard safety mechanism by separating the reactive materials and closing the pores when the battery reaches elevated temperatures.
Celanese has been a trusted material supplier into these end markets since the beginning and continues to support the industry as performance demands increase with expanding use in different applications. Our GUR® UHMW-PE portfolio covers the entire spectrum of molecular weights, particle size and morphology which offers a rich set of options for manufacturers to choose from when searching for the right material for their particular process and performance targets.

In addition to unrivalled choice of materials, Celanese UHMW-PE offers the best balance between mechanical strength and porosity. As seen in the graph at the bottom of this page, membranes made with GUR® UHMW-PE offer the best puncture strength versus membranes of comparable permeability made from competitive materials.

Celanese is well positioned to globally supply with high performing materials as well as technical know-how. Our Technology and Innovation team is there to support you with material selection and testing to help accelerate your efforts to keep pace in this fast-paced and dynamic industry.
Pressureless sintering of the powder can be achieved in one process step. Alternatively, the starting material is sintered into semi-finished products such as sheets, films, pipes, and solid rods, and then fabricated into final products in a second step.

**Benefits of GUR® UHMW-PE**

- Well controlled porosity and flow resistance
- Improved damping behavior
- Excellent uniformity of raw material
- High consistency of powder properties and quality
- Good compatibility with other filter media such as activated carbon
- Good mechanical strength
- Outstanding chemical resistance
- EUP, FDA, USDA and NSF (51 & 61) compliant grades

**Applications/Functionalities**

- Filtration, separation
- Fluidizing, venting, degassing, silencing
- Storage, wicking, support

GUR® UHMW-PE high performance powder is a versatile sintering material with universal application. Under carefully controlled thermal treatment and suitable processing technology, porous parts with exceptional properties can be produced from this material.

GUR® UHMW-PE has an extremely high melt viscosity due to its average molecular weight of up to 12 million g/mol. When heated above its crystalline melting point of about 134°C, the polymer changes into a viscoelastic melt. In this process, the external form of the polymer particles is substantially retained, and only the surface of the individual polymer particles fuse at their contact points forming a porous network.
Processors can choose between powders with different particle size, particle size distribution, bulk density, particle surface, molecular weight and powder morphology (spheroidal or flocculent). In this way the porosity and geometry of the porous part can be tailored to suit specific application requirements. Despite their interconnected cell structure, porous products made from GUR® UHMW-PE high performance powder possess surprisingly good mechanical properties such as high strength and flexural resistance. In combination with their excellent resistance to most chemicals, all of these outstanding properties make porous parts made from GUR® UHMW-PE suitable for many demanding applications.

Some examples of GUR® UHMW-PE used in porous applications include liquid and dust filtration, silencers for sound damping and ink management for writing instruments.
GUR® UHMW-PE
Carbon Blocks for Water Filtration

Processing
GUR® UHMW-PE is blended with activated carbon (or other active materials) and sintered into blocks either by mold sintering or by extrusion.

Unique properties
Due to its high molecular weight, GUR® UHMW-PE provides some unique properties for the manufacturing of water filters.
- In molten state, material does not flow due to its high viscosity but just softens
- Particles retain their shape and morphology and act as a binder matrix
- The active carbon is immobilized, forming a solid structure

Benefits of GUR® UHMW-PE
Filtration efficiency is determined by the active surface area of the carbon. A high surface area allows more harmful contaminants to be removed from the water and bonded to the carbon. There are no channeling effects in the active media as seen in loose packaging. GUR® UHMW-PE outperforms other thermoplastic materials such as HDPE and LDPE.
- Maintains high carbon surface area
- Ensures high utilization of carbon
- Increases filtration efficiency and longer component life

Applications
- Counter-top and under-the-counter carbon block filters
- Sports and drinking water bottles
- Faucet-mount filter for point-of-use filtration
Cleaner Water with GUR® UHMW-PE for Filters

According to the World Health Organization and the United Nations, an average person needs 20 to 50 liters of clean water per day. One in 6 people worldwide lack access to clean water, often resulting in serious—even life-threatening—health issues. A common solution to cleaning contaminated water is to filter it at the point of use with active media like carbon.

Harmful substances – such as chlorine, lead, mercury, cadmium, asbestos and volatile organic chemicals – are then absorbed by the carbon. The carbon can be granulated or bound with GUR® UHMW-PE for significantly increased filter performance.

GUR® UHMW-PE is the world leader in porous applications, with the broadest portfolio, including specialty products designed specifically for filtration components for cleaner, safer water.
**GUR® UHMW-PE**

Functional Additives

**Benefits of GUR® UHMW-PE as an additive**

Major property improvements which may be achieved in a matrix material by adding GUR® UHMW-PE

- Excellent scratch/cut/abrasion resistance
- Unique surface texturing
- Anti-slip properties
- Improved mechanical properties, e.g. impact strength and flexural modulus, decrease crack propagation
- Improved dynamic coefficient of friction (sliding properties)
- Energy absorption
- Mechanical and dimensional thermostability
- Broad application temperature range (between -265 °C and 90 °C)
- Improved mechanical dampening behavior
- Improved chemical resistance and noise reduction
- Reduced water affinity and moisture absorption
- Biocompatibility & environmental friendliness (no fluorine content)
- Good matrix compatibility and binding/phase connection due to unique particle morphology characteristics

GUR® UHMW-PE micropowders have exceptional properties as additives in a wide range of applications. In the molten state, because of their very high melt viscosity, they exhibit a rubber-elastic behavior and therefore maintain their particle shape and morphology.

This thermal-rheological property is of paramount importance for numerous applications. GUR® UHMW-PE micropowders are available in various particle sizes, tight particle size distribution and unique morphologies.

**Example applications**

- Protective coatings
  - Texturing additive, scratch resistance, dry lubricating additive
- Decorative paint
  - Matting agent
- Technical rubbers
  - Processing aid, wear resistance enhancer
- Sealants
  - Dispersant, co-binder, anti-scratch additive
- Plastic compounds & packaging
  - Slip/anti-slip additive, surface effects
- Cosmetics & industrial soaps
  - Soft peeling/scrubbing additive

**Functions and key benefits**

- Protective coatings
- Decorative paint
- Technical rubbers
- Sealants
- Plastic compounds & packaging
- Cosmetics & industrial soaps

The SEM picture shows good binding of the structurebody of 60µm-product with the paint layer (Layer thickness 80 microns).
In contrast to regular GUR® UHMW-PE, which is inherently hydrophobic (repels water), hydrophilic GUR® UHMW-PE grades have an affinity to water. This property is desired in certain filtration and wicking applications but also important for bonding certain paints and adhesives.

Several methods are known how to reverse polyethylene’s behavior toward water. One approach is blending with additives or grafting of hydrophilic polymers which give the final parts certain hydrophilicity. Drawback is however, that over time the respective substances can be washed out resulting in a loss of wettability. In order to achieve a longer lasting effect technologies are applied to partially oxidize the outer surface of GUR® UHMW-PE (chemical bonding of polar groups → increase of surface energy). The oxidation can be obtained by classical chemical reaction with oxidizing agents like H2O2 but also by plasma treatment, or by oxyfluorination.

Nowadays plasma treatment is the predominant technology, using a simple process gas like oxygen or air to replace hydrogen by polar functional groups.

Applications with a necessity for hydrophilic GUR® UHMW-PE high performance powder are versatile; however always display a combination of the requirement for a hydrophilic material with the unique properties of GUR® UHMW-PE, like Mw, chemical resistance, particle size, bulk density, and particle size distribution.

In wicking devices (e.g. writing nibs – see p. 18/19) liquids will travel along the pores of sintered GUR® UHMW-PE structures at a controllable rate. The effect can be enhanced with hydrophilic GUR® UHMW-PE allowing for better transport and wicking.

Hydrophilic GUR® UHMW-PE is used in writing elements to improve the wicking, medical diagnostic devices, specialty filters, and other pharmaceutical release applications, where solutions are drawn from a reservoir.
The strength-to-weight ratio of GUR® UHMW-PE-based fibers is unmatched when compared to other polymeric fibers. Fiber tenacities exceeding 35 grams/denier and moduli greater than 1,300 grams/denier are possible. These properties combined with the low specific gravity offer many technical and commercial advantages. Marine ropes and nets made with GUR® UHMW-PE are lightweight, making them easier to transport, and they also improve fuel economy. Cut resistant gloves offer better dexterity and overall comfort, leading to better compliance and reduced injuries. GUR® UHMW-PE-based fabrics and composites offer ballistics protection by absorbing and dissipating the energy that are associated with particular threats. In the ballistics market, there is a constant trade-off between performance, weight and cost in regard to ballistics solutions. The need to improve ballistics performance continues as threat levels increase around the globe. GUR® UHMW-PE is leading the way to develop new materials that enable improved performance and lower-weight solutions.
Solid-state technology, which makes it possible to produce high-tenacity tapes and articles from GUR® UHMW-PE without the use of plasticizers or solvents.

Benefits of GUR® UHMW-PE converted to tapes

- High strength and modulus
- Low specific gravity
- Abrasion resistance
- Creep resistance
- Excellent chemical resistance
- Single polymer composite structure

Applications:

- Ballistics composites and articles
- Marine and industrial ropes
- Construction and reinforced panels
- Industrial textiles

The technology exists that makes it possible to orient GUR® UHMW-PE to obtain high-tenacity tapes and articles. This approach offers multiple advantages compared with conventional gelation processing. Solid-state conversion eliminates the use of plasticizers and solvents and, as a result, simplifies manufacturing costs and complexities. Furthermore, the conversion to ballistics panels is also simplified because GUR® UHMW-PE-based tapes can be arranged and layered in the typical 0°/90° configuration without the need of binders.

In ballistics, GUR® UHMW-PE-based tapes ideally offer cost advantages when trying to balance weight and ballistics performance. This is most evident for vehicle-armor applications, where relatively large surface areas need protection.

Beyond ballistics, significant opportunities exist for solid-state tapes. Marine and industrial ropes could take advantage of the inherent creep resistance compared with more conventional polyolefins. Industrial ropes could fill a performance “gap” in the mid-tenacity range. Large reinforced panels could be combined with other polyethylene sheets to improve modulus and make single polymer composites.
Our premium implant grades are now available with vitamin E

Today, most implants are treated by modern irradiation techniques for sterilization and/or performance improvement. As a result of these processes, free radicals are formed in the UHMW-PE which can accelerate in vivo oxidation and shelf aging of the implants. Degradation of the material results in reduced mechanical properties, including reduced wear resistance.

Vitamin E is a collective term for the group of tocopherols, of which alpha-tocopherol shows the best properties as an antioxidant. It is a natural substance that already exists in the human body and can be used as a stabilizer for the orthopedic implants made from UHMW-PE. Alpha-tocopherol acts as a radical scavenger and eliminates the free radicals preventing oxidation of the material.

Celanese now provides the first vitamin E powder blend available on a commercial basis. The material is produced in accordance with ASTM F2965 and can be processed like virgin GUR® UHMW-PE premium powder. All mechanical properties remain unchanged compared to the original GUR® UHMW-PE premium grades. The blend follows the typical high standards of product cleanliness and shows a very uniform vitamin E distribution.

Illustration of homogeneous distribution of vitamin E
Benefits of GUR® UHMW-PE

Celanese, as the leader in UHMW-PE with over 40 years of application experience, helps meet the needs of orthopedic surgeons with proven long-term materials performance in joint replacements.

GUR® UHMW-PE outstanding properties

- Low wear
- High purity
- Biocompatibility
- Excellent lubricity
- Abrasion resistance
- High energy absorption

This combination of properties opens up a wide range of applications for GUR® UHMW-PE in the orthopedics device sector.

The biocompatibility and flexibility of part design have led to GUR® UHMW-PE’s successful use in orthopedic implants for over 40 years. As a result of continual product optimization, GUR® 1020 and GUR® 1050 are now the most frequently used materials for articulating bearing surfaces in orthopaedic surgical implant technology.

Celanese has taken into account the special requirements of medical technology for orthopedic implants by ensuring exceptionally high quality and compliance with the approval and conformity criteria of regulatory agencies: USP Class VI, FDA Master Files.

For further information on ultra high molecular weight polyethylene in medical implants, please visit: www.uhmwpe.org

Sponsored by Celanese
The European Pharmacopoeia (EUP) defines requirements for the qualitative and quantitative composition of medicines, the tests to be carried out on medicines and on substances and materials used in their production. The European Directorate for the Quality of Medicines and Healthcare is responsible for maintaining the EUP which is current on version 8.0.

Building on our extensive experience in implant grade materials, Celanese is pleased to announce the introduction of a new line of GUR® UHMW-PE grades which are compliant with Monograph 3.1.3 of the EUP 8.0. Confirmation of conformity to EUP 8.0 is a common requirement for many applications in the more sensitive areas of medical, clinical sciences and life sciences fields.

EP grades are produced to ensure compliance to all specifications laid out in monograph 3.1.3 which includes strict limits on elements such as ash content, heavy metal extractables, acidity and alkalinity. Material comes with Celanese confirmation of conformity.

Currently the following EP grades are commercially available. Additional grades could be developed if sufficient market demand exists. Please speak with your Celanese sales representative if the grade you are interested in is not listed on the left.

Benefits of EP compliant Grades
- Produced to meet strict requirements of EUP 3.1.3 (Polyolefins) Version 8.0
- Material tests to confirm compliance

Applications
- Filtration of bodily fluids (e.g. blood)
- Drug reservoirs or venting
- Medical packaging
- Chromatography, separation, affinity and extraction filters
- Clinical sciences diagnostic filters

Available GUR® UHMW-PE EUP compliant grades
- GUR 2122 EP
- GHR 8020 EP
- GUR 4022-6 EP
- GUR 4012 EP
- GUR 4018 EP
- GUR 4050-3 EP
With these melt processable grades, GUR® UHMW-PE can be applied to broader applications that would benefit from its very unique properties.

For example, these grades can be used to make extruded pipes, pipe liners or composite pipes, which offer a highly abrasion resistant solution extending the lifetime of the pipe and therefore reducing ongoing maintenance costs. GUR® UHMW-PE’s low coefficient of friction also means less energy required for pumping, less frequent clogging of pipes and, depending on the pipeline design, smaller diameters compared to conventional pipe systems.

With deep knowledge and expertise on materials and processing, Celanese is the ideal partner to identify the optimal solution to address your needs.

**Melt processable GUR® UHMW-PE**

As described in the GUR® UHMW-PE unique properties section, GUR® UHMW-PE is characterized by its lack of melt flow, which usually requires special processing technologies such as compression molding or ram extrusion.

Therefore, we have developed special melt processable grades which maintain the unique properties of GUR® UHMW-PE while being compatible with the following process technologies:

- Screw extrusion
- Injection molding
- Injection compression molding
The home of our dedicated Research and Development team remains in our Oberhausen site where Dr. Karl Ziegler originally brought his exciting new catalyst technology back in 1955.

Since then our R&D group remains at the forefront of UHMW-PE development in the world and remains committed to driving value-added technologies in the future.

Today the group can be subdivided into two parts: 1) New product development and 2) New application development. These two groups both work in close coordination with our internal teams, customers and development partners to deliver novel solutions.
New product development

This group is focused on developing new polymerization and process technologies to enable new product properties meeting the needs of our customers. Our research facility has a complete pilot plant facility which provides an efficient development pathway from lab to manufacturing scale.

Our research facility has a complete pilot plant facility, which provides an efficient development pathway from lab to manufacturing scale.

New application development

The application development group is working closely with our commercial team and customers to find new innovative application areas for GUR® UHMW-PE. A close relationship with existing customers as well as other interested development partners allows us to tailor products to the need of the market for known or new applications. Examples may be membranes, fibers, or the use of GUR® UHMW-PE particles as additives to improve the properties of other materials. Our Research center is equipped with all of the latest processing and test equipment which is able to translate the basic material properties to very special market needs.
Regulatory Approvals

Assessment under food legislation the GUR® UHMW-PE and GHR® standard grades, in natural color, when used in accordance with recommendations given in our product literature and in accordance with 21 CFR 177.1520, meet the applicable FDA polyolefin regulation, including specifications 2.1 and 2.2.

GUR® 4120, GUR® 4130 and GUR® 4150 are approved by the USDA for direct contact with meat or poultry prepared under Federal inspection. In recommendation (Empfehlung) III “Polyethylenes”, the German Federal Institute for Consumer Health Protection and Veterinary Medicine (BgVV) regulates the use of polyethylene for the manufacture of consumer articles as defined in Article 5, Para. 1, No. 1 of the German “Food and Consumer Articles Law” (LMBG).

The BgVV recommendations lay down in accordance with the present state of science and technology under what conditions a consumer article made from plastics satisfies the requirements of Article 31, Para. 1 of the LMBG. The recommendations state that articles must be suitable for their intended application and should not impart odor or taste to food. All basic grades (see section 1.1) comply with Recommendation III. There are therefore no objections on health grounds to the use of these materials for the production of consumer articles for food contact applications.

Quality management

The fulfillment of the quality requirements of our customers is a fundamental principle for Celanese. In this process we are constantly updating our certification and processes. Our processes have been registered since the early 1990’s under ISO 9000.

From this base in 2003 Celanese built “The Integrated Management System” (TIMS).

The most important certifications for Celanese include:

- ISO 9001
- ISO/TS 16949
- ISO 14001

Certification to the standard ISO 9001 and ISO/TS/6949 has been achieved by all Celanese production sites. Also we have the environmental standard ISO 14001.

For the up to date certification information please refer to our home page www.celanese.com where copies of our certifications are available for download.
### GUR® UHMW-PE

#### Typical Physical Properties & Test Methods
